

Smart IR begins before the breach.

"We never planned for such an event and therefore had no systems or processes in place to adequately respond. As a result, numerous wrong decisions were made while responding to the breach"

—Tom Plunkett, CTO Gawker Media

Hoping a breach never occurs is not an effective Incident Response strategy. The time to plan is now, and the path to a strong Incident Response Plan begins with the Mainstream IR Gap Analysis.

The Mainstream IR process is built on industry best practices taken from CERT, SANS and NCFI methodologies—whose course curriculum is developed by Department of Defense.

We use these key methodologies to measure your strengths and weaknesses. Through a proprietary evaluation process Mainstream conducts a series of interviews with key stakeholders (IT management, security, HR, Legal, and user support) to gain valuable insight into your IR process as it stands today.

Our 125-question evaluation coupled with our industry expertise will provide an executive and technical level report that clearly illustrates your risk posture. We prioritize key areas of concern, and clearly measure the health of your response capability.

This actionable roadmap can then be implemented and supported by Mainstream and your team. Together developing a partnership that helps provide world-class response on a limited budget.

SMARTIR Facts about Breach Management:

- One in Four companies suffered a security breach in the last year
- Only a quarter conducted forensic analysis following the breach
- Only half had taken steps to remediate and protect systems after breach

(as reported by a survey by McAfee and SAIC, 2012)
